Recently Banned Pesticides
Do not buy products containing Chlorpyrifos (Dursban™, Lorsban™) or Diazinon, as the EPA has concluded they pose unacceptable health risks.

New Massachusetts Pesticide Law
To protect children, all schools in the state must now restrict pesticide use. It’s up to you to protect them at home.

Herbicides in Compost Warning
Do not compost grass clippings treated with the herbicides clopyralid (in Confront™) or picloram, or allow grass clippings from treated lawns to go to municipal compost facilities. The resulting compost can kill plants.

This program is funded in part by grants from the Toxics Use Reduction Institute at the University of Massachusetts, Lowell, and the Massachusetts Department of Environmental Protection.

Healthy Lawns and Landscapes

Massachusetts Pesticide Awareness Collaborative

Imagine your kids playing on grass that isn’t treated with pesticides.
Your kids can play on nice grass you never need a “Keep off, Pesticide Application” warning sign.

Imagine watering costs cut in half!
Healthy soils with thriving micro-organisms lead to deep-rooted grass. Deep roots require less watering, less fertilizing, and save you money.

Imagine no mowing!
Turn part of your lawn into a landscape with a diversity of native plants, hardy flowers, ground covers, trees and shrubs. Low maintenance, native plants include blueberries, azaleas, bearberry, dogwood and red bud trees.

Now is the time to make the move to non-toxic lawn care. For yourself, your children, your pets and the environment.

Pesticides are poisons. Pesticide exposure in humans has been associated with birth defects, numerous cancers, Parkinson’s disease and other neurological disorders, male infertility and immune system problems.

An EPA registration number does not mean safety. The health effects of most pesticide ingredients, their breakdown products, and their interactions are not well known.

Lawn pesticides get carried indoors by shoes, paws and air currents. Once inside, pesticides linger in carpets, dust, toys and air. Away from sunlight and water, pesticides can persist for many months.

Pesticides contaminate drinking water. Use of pesticides in urban and suburban communities contributes significantly to contamination of our water supplies.

Children are particularly vulnerable to the toxic effects of pesticides. Children are at risk for birth defects, childhood cancers and behavioral problems when household and lawn pesticides are used.

Children are more at risk because of their size and behaviors. In a recent study of preschoolers, 99% had one or more pesticides in their bodies.
**Simple Steps to Organic Lawn Care**

The easiest, most cost effective way to a beautiful, healthy lawn is to work with nature, not against it. A healthy lawn needs nutrients and microbe-rich soil to develop deep roots, dense turf that competes successfully with weeds. Dense turf is beautiful and low maintenance. It naturally resists drought, insects and diseases.

**Pesticides are not necessary for a beautiful lawn.** In fact, they can do more harm than good. They kill the microbial life necessary for healthy soil and can kill the pest's natural enemies. This invites disease and insect infestations, which leads to more pesticide use and traps you in an unhealthy, costly chemical cycle.

**Basic lawn care tips:**
- Spread 1/4" compost, or sprinkle organic fertilizer, each fall.
- Seed with a mix of hardy grasses.
- Mow high! Keep mower blades sharp.
- Leave grass clippings on lawn as fertilizer.
- Water only when soil is dry 6" down. 1" water per watering.
- Overseed in the spring and fall.
- Strive for a soil pH around 6.8.

---

**Yearly Schedule**

- **March & April**
  - Sharpen mower blades.
  - Raise mower blade to 3 inches.
  - Add soil amendments based on soil test. Re-seed bare spots, or apply corn gluten to prevent weed germination. Always leave clippings on lawn to fertilize.

- **May and June**
  - Check for weeds; pull out by hand.
  - Re-seed bare spots.
  - Monitor for insect pests.
  - If you have grub damage, spot treat with milky spore (once every ten years) and/or with beneficial nematodes (once yearly for 2 or 3 years).

- **August**
  - You may allow lawn to go dormant during drought. It will green up after rain.

- **September and October**
  - Best time to seed (generously). Fertilize if needed (sparingly) or top dress with 1/4 inch compost.
  - Aerate if soil is compacted.
  - lime if an autumn soil test finds pH lower than about 6.8.

- **November**
  - Final mowing at 2 inches for easier leaf raking.

---

**Managing Your Lawn Service**

- Specify mowing high with sharp blades.
- Request corn gluten and organic fertilizer instead of “Weed and Feed” products.
- Refuse routine application of pesticides.
- Beware if a lawn service tells you a chemical application is safe. EPA regulations prohibit manufacturers from making pesticide safety claims, even if used as directed. All pesticides must be treated with caution.
- Never allow unidentified products to be used on your lawn. Request safety information and read it before application. Look up toxicity at www.pesticide.org.
- Be aware that chemicals listed as inert ingredients can be highly toxic.
- Take note: many pesticides persist in lawns and soil long after the posted 24-72 hours.
- Ask for an organic program. Know that an organic lawn can take up to 3 years to fully establish.

**Simple Organic Lawn Care** has been defined by the Northeast Organic Farming Association in their Standards for Organic Land Care. Order a copy from www.massorganic.org.

**Organic Lawn Service is available in our area.** Check for current listings at www.organiclawns.org.
